

SE Lab 3 - Architecture Justification

Name - Samyak Sanklecha

SRN - PES2UG24CS436

- architecture i chose

so for the coffee kiosk i decided to go with the Layered architecture. honestly it just made the most sense to me since the whole thing kinda works top to bottom anyway.

- reason 1

my first reason is that its basically just one standalone machine, so i broke it down into presentation, business and data layers. the touch screen on top, the order logic in the middle, and the menu and pricing data at the bottom. that felt right to me.

- reason 2

second reason, i feel like it keeps everything nicely separated. like if i wanna swap the receipt printer or change the payment part later, i can just mess with that one layer and not break the whole ordering flow. atleast thats how i get it.

- security advantage

for security im assuming layered helps since the card and payment stuff stays lower down and the user never really touches it directly. the touch screen cant get to the card data on its own, it has to go through the order manager first, so ya that feels safer.

- performance benefit

performance im not fully sure honestly, but i feel like since the menu and pricing sits in the data layer, the kiosk can grab it pretty fast without going out anywhere. so even when the cafe is busy the orders should still load quick.
